

The following information reflects our process.

General Features:

Virtually Maintenance Free

No water, pesticides, or trimming are ever required. The occasional dusting is all that is needed.

Appear identical to living plants

Being made from the actual plant, the authenticity of these plants is astounding. The fronds and trunks of living plants have been preserved using our patented process, ensuring a natural beauty that can never be replicated by any faux plant. No one will know they are preserved unless you tell them.

Custom Design

We can custom build and design our palms to suit your project and overall shape requirements. Our palms range from 5 to 60 ft., and come in single or multi curved clusters. If special engineering is required, our palms can be seismically and structurally engineered upon request.

Competitively priced to high quality silk and living plants

Our palms and plants save you maintenance and replacement dollars. They also provide considerable savings in hidden costs when dealing with living or silk plants.

Ideal for Locations with Little or No Light

Our palms and plants have no need for natural or artificial light, other than to view their lush green foliage.

Lightweight and Easy to Install

All components come in separate corrugated cartons. The average weight per palm trunk is 7 to 9 lbs. per foot.

Internally Fire Retardant

All of our Preserved Washingtonia Fan and Phoenix Date fronds include internal fire retardant, which have been tested and approved by the State Fire Marshal for products identified in the Health and Safety Code.

Our products meet the minimum requirements of flame resistance established by the State Fire Marshal.

Our trunks can also be externally fire proofed upon request at an additional fee. All fire retardant trunks have been tested and approved by State Fire Marshal including ASTM-84-E 95B - NFPA Class A.

State Fire Marshal Flame Resistant Certificates are available upon request.

How we do it - The making of a preserved palm

The Phoenix and Washingtonia palm fronds and bark components are harvested from our harvesting facility (210 acres of company owned land). This facility contains over 100,000 trees. The fronds are carefully taken from the live trees, and then internally treated with our proprietary organic formula. All fronds include internal fire retardant that has been tested and approved by the State Fire Marshal for products identified in the Health and Safety Code.

The bark, which is also harvested, is then carefully assembled onto a PVC pipe in a manner that mimics the way a live palm grows. The bark is not preserved in any way. It is hand built (piece by piece) on to a PVC pipe with steel interior and backfilled with high-density foam. The top of every trunk has a steel receiver head with receptacles (holes) used to insert and support the preserved fronds. Every receiver head is custom built with up to 45 receptacles. Our clients have the option to choose the amount of fronds (anywhere from 25 to 45) to be used for each receiver head, depending on the overall look desired.

Finally a steel base plate receiver with a protruding steel center pipe (anywhere from 2 to 5 feet) is specially built to slide the trunk into as a support system. For taller palms, these base plates can be directly bolted to a concrete floor. If special engineering is required our palms can be seismically and structurally engineered. In addition, electrical conduit pipes can be added within our trunks for special effect lighting, security cameras or speakers that can easily be mounted at the top of the palm. We custom build our palms anywhere from 5 to 60 ft. and have installation specialists available for projects worldwide.

Limited Warranty:

All palms include a four (2) year limited warranty on preserved fronds and a ten (10) year warranty on palm trunks. Every palm is personally inspected by our in house internationally renowned horticulturist, to insure that you receive the best internally preserved product.

All preserved plants & junipers include a (2) three-year warranty. The required storage and installation guidelines for the warranty to remain in force are as follows:

Humidity Levels: to be between 30 to 75% (not to exceed 75%)

Temperature Levels: Best when in air-conditioned room.

Light Intensity: No direct sunlight, spotlights at close range, or heat source on preserved fronds.

We recommend that preserved palms & plants be placed in an interior location with indirect light to ensure many years of natural lasting beauty.

Precautions

Our palms and plants are to be used for interior locations only. They are not for outdoor use. Optional RF- Once UV/Moisture Seal Protective Coating.

We Ship Worldwide.
